PROJECT PRESENTATION

PrintEase

A Flutter-Based Smart Document Printing and Management System

Name: Ahmad Muhammad Ibrahim

Registration Number: KASU/DIP/CSE/24/0004

Institution: Kaduna State University (KASU)

INTRODUCTION

In contemporary academic and corporate environments, document processing remains one of the most critical yet operationally inefficient tasks. Whether it involves students printing final-year research projects, submitting daily course assignments under tight deadlines, or administrative staff handling bulk documentation, printing is an indispensable aspect of campus life.

Despite rapid advancements in mobile computing and cloud services, traditional document printing workflows remain predominantly manual and fragmented. PrintEase was conceptualized and engineered to bridge this gap, modernizing physical print request management through a unified digital platform.

PROBLEM STATEMENT

An analysis of daily document processing routines at tertiary institutions like Kaduna State University reveals several systemic bottlenecks:

1. Customer / Student Perspective

- **Queue Congestion & Time Loss:** Students routinely spend excessive time waiting in physical queues at commercial business centers to print standard documents.
- **Cybersecurity & Storage Vulnerabilities:** Transferring files via physical USB flash drives across unsecured cybercafé terminals regularly exposes personal storage devices to malware and file corruption.
- **Formatting Discrepancy & Waste:** Cross-platform software version mismatches frequently alter document layouts, margins, and fonts upon rendering, leading to incorrect prints and wasted paper.
- **Lack of Order Transparency:** Traditional setups lack status tracking, requiring users to remain physically present at the shop without knowing when their order will be completed.

2. Service Provider / Print Operator Perspective

- **Counter Bottlenecks:** Operators waste substantial operational time receiving files via varied channels (emails, flash drives, instant messaging), taking manual payments, and configuring settings per customer.
- **Disorganized Queue Management:** Verbal or paper-based order management leads to job mix-ups, miscalculated page counts, and overall workflow degradation.
- **Unoptimized Batch Operations:** Operators are unable to group similar print jobs (e.g., bulk black-and-white vs. color runs) efficiently due to ad-hoc, walk-in arrival patterns.

THE PRINTEASE SOLUTION

PrintEase resolves these challenges by transitioning traditional physical queues into an automated, asynchronous digital pipeline. Built using the Flutter framework and Dart programming language, the system provides a seamless cross-platform experience for both document owners (students/customers) and service providers (print shop operators).

The application allows users to remotely upload documents, configure precise printing specifications, monitor job progression in real time, and only visit the print center once their documents are processed, collated, and ready for pickup.

SYSTEM ARCHITECTURE & CORE CAPABILITIES

The platform is structured into two primary functional domains:

1. Customer Interface

- **Cross-Platform Compatibility:** Responsive layout rendering across Android mobile applications and web browser interfaces.
- **Secure Document Submission:** Direct cloud file selection (PDF and standard document formats), eliminating reliance on physical USB drives.
- **Granular Print Customization:** Pre-submission configuration options, including:
    - Page range and copy count.
    - Color mode selection (Monochrome vs. Full Color).
    - Media size selection (A4, A3, letter) and orientation.
    - Duplexing options (Single-sided vs. Double-sided printing).
- **Real-Time Lifecycle Tracking:** Live updates indicating current job states: Submitted, In Progress, Ready for Pickup, and Completed.

2. Operator Management Dashboard

- **Centralized Job Queue:** Chronologically ordered dashboard displaying all incoming print requests in a structured queue.
- **Automated Job Specifications:** Instant extraction of total page counts, color choices, and finishing requirements, eliminating manual verification.
- **State Management & Notifications:** Single-click order status modification that reflects immediately on the customer’s interface.

TECHNICAL IMPLEMENTATION & ENGINEERING CONSIDERATIONS

The engineering phase of PrintEase addressed key full-stack and mobile infrastructure requirements:

- **Declarative UI & Responsiveness:** Leveraged Flutter's declarative widget tree to achieve consistent, pixel-perfect rendering across varying mobile viewports and desktop resolutions.
- **Build Pipeline & Compiler Configuration:** Resolved target compilation constraints by configuring Android Gradle Plugin settings, establishing explicit JVM target compatibility (Java 17), and aligning Kotlin DSL properties for ARM64 release binaries.
- **Decoupled Architecture:** Implemented clear separation between business logic, state management, and view components to ensure high performance, maintainability, and scalability.

PrintEase

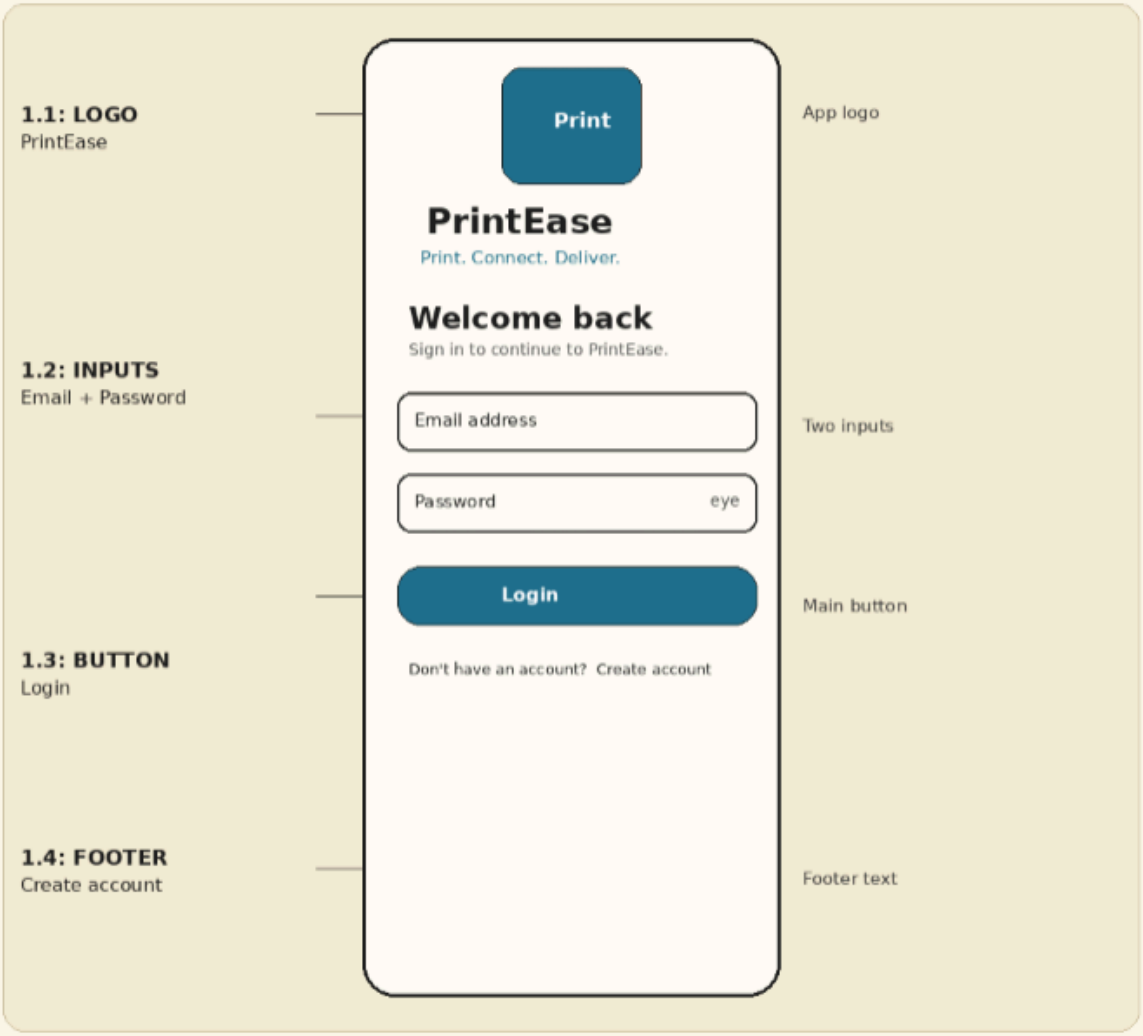

Print. Connect. Deliver.

Welcome back

Sign in to continue to PrintEase.

Email address

Password

1. Explanation

Figure 1: Welcome Back Screen - Sketch

This is the first screen of PrintEase. It shows the PrintEase logo and slogan "Print. Connect. Deliver." and asks the user to enter Email Address and Password. Tapping Login opens the Home Page. The eye icon lets the user show or hide the password.

The screen is simple and clear. At the bottom, the text "Don't have an account? Create account" lets a new user create a new account and start using the app without confusion.

2. Explanation

Figure 2: Shop Dashboard Page - Sketch

This is the Shop Dashboard Page of PrintEase. It helps the shop owner manage the shop and customer requests.

At the top, it shows the title "Shop dashboard" and the message "Manage your shop and customer requests." Below it, the "Set up your shop" card lets the owner register the shop so customers can find it.

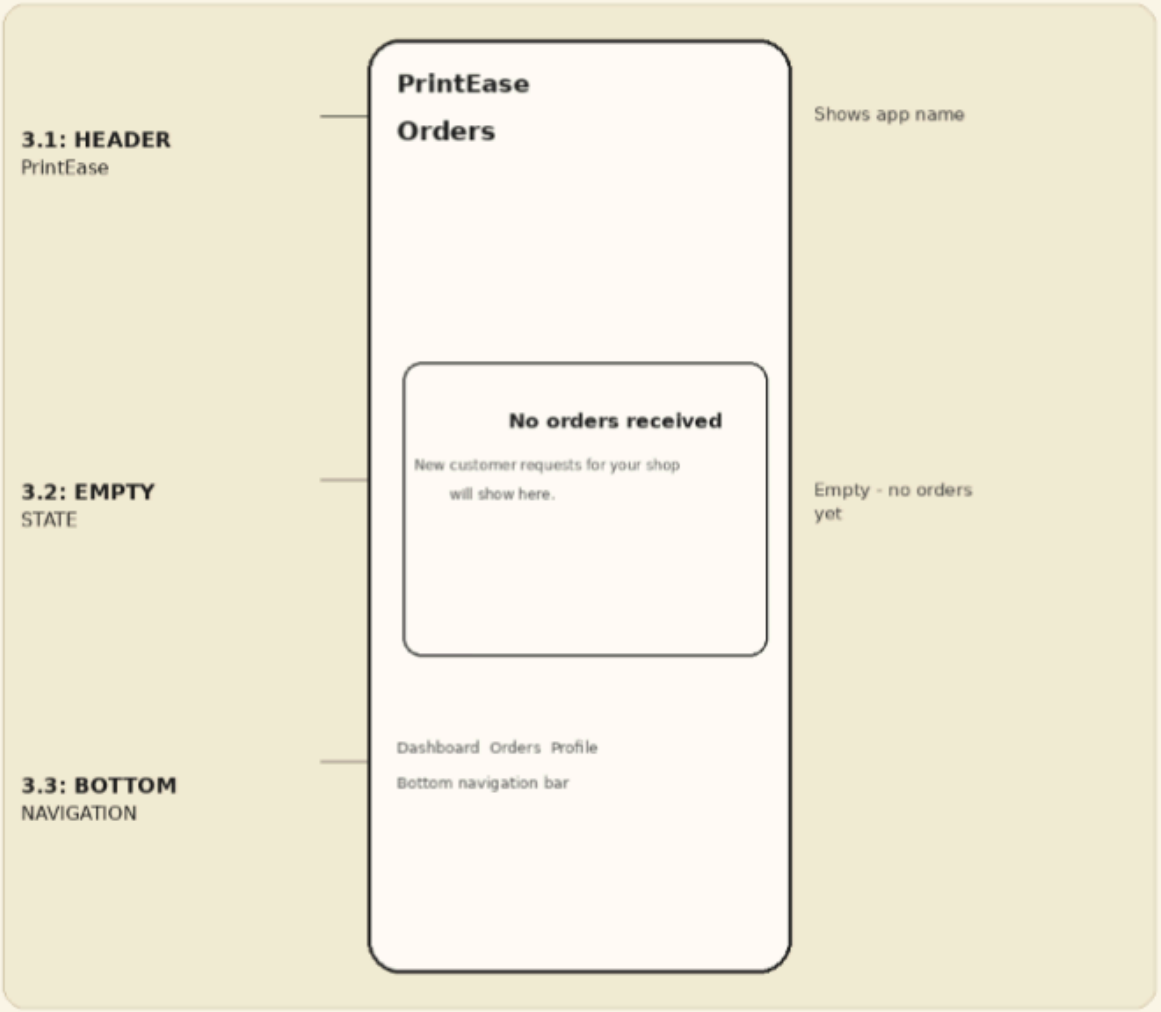

7:35

PrintEase

No orders received

New customer requests for your shop will show here.

3. Explanation

Figure 3: Orders Page - Sketch

This is the Orders Page of PrintEase. It shows all the customer orders that come to the shop.

At the top, it shows the PrintEase logo and the title "Orders". The middle of the page is empty. It says "No orders received" and "New customer requests for your shop will show here."

This means no customer has sent an order yet. When a customer sends a request, it will appear on this page. The bottom bar lets the user move to Dashboard, Orders and Profile.

4. Explanation

Figure 4: Profile Page - Sketch

This is the Profile Page of PrintEase. It shows who is logged in and the settings for the shop owner.

At the top, it shows the name MUHAMMAD AHMAD and the role "Shop Owner". Below it are five menu cards:

My shop - Register or update your shop listing, Account information - View and edit your profile details, Notifications - View updates about your orders, Help and support - FAQs and guidance for using PrintEase, and About PrintEase - Learn about the app.

CONCLUSION

PrintEase demonstrates a practical, end-to-end software solution to real-world workflow inefficiencies within academic and professional hubs.

1. For students, it eliminates queue-related time loss, mitigates malware transmission risks, and simplifies academic submission workflows.
2. For print vendors, it increases operational capacity, organizes queue handling, and elevates service turnaround times.

This project successfully integrates core principles of computer engineering and software design—ranging from frontend user experience and system state management to build environment optimization and platform deployment.
